21. Ockham's Razor

Conclusion

Synopsis of Areas for Improvment

Cognitive Biases & Nudging

Cognitive Biases That Influence Purchase Behaviour & Decision Making

Category Heuristics: Short descriptions of key product specifications can simplify purchase decisions.

Power of now: The longer you have to wait for a product, the weaker the proposition becomes.

Social proof: Recommendations and reviews from others can be very persuasive.

Scarcity bias: As stock or availability of a product decreases, the more desirable it becomes.

Authority bias: Being swayed by an expert or trusted source.

Power of free: A free gift with a purchase, even if unrelated, can be a powerful motivator.

Category Heuristics

Category heuristics are shortcuts or rules of thumb that aid us in making a quick and satisfactory decision within a given category. An example would be focusing on how many megapixels (MP) the camera has when purchasing a smartphone or how many gigabytes (GB) of data are included in a mobile phone contract.

Princeton psychologists, Shah and Oppenheimer found heuristics reduce cognitive effort through the following impacts on decision-making:

- Examining fewer pieces of information
- Relying on easy-to-access pieces of information
- Simplifying the weighting of information
- Integrating less information in a decision process
- Considering fewer alternatives overall

Category Heuristics in Product:

About This Experience

Inclusions & Exclusions

Overall

The general usage of heuristics on the WL product is good. A potential improvement would be to highlight some of the most important pieces of information in the wider booking flow e.g: Duration, 1st Inclusion.

Authority Bias

Authority bias describes the tendency to alter our opinions or behaviours to match those of someone we consider to be an authority on a subject. When we're unsure, we tend to follow the lead of people we believe to be credible and knowledgeable experts and therefore may use an authority view as a mental shortcut.

Authority Bias in Product:

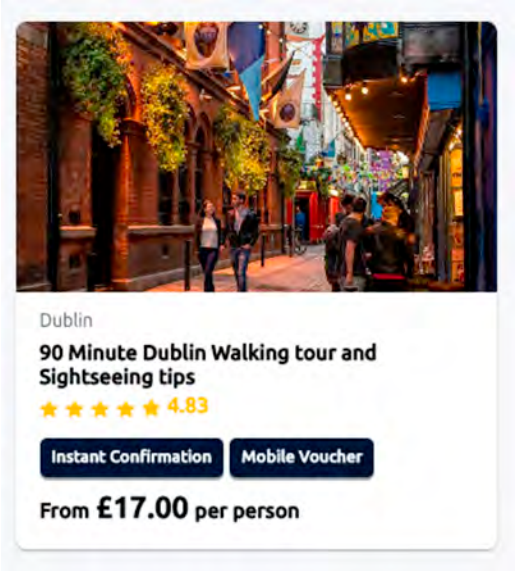
There are currently **no** expert recommendations on the White Label Product

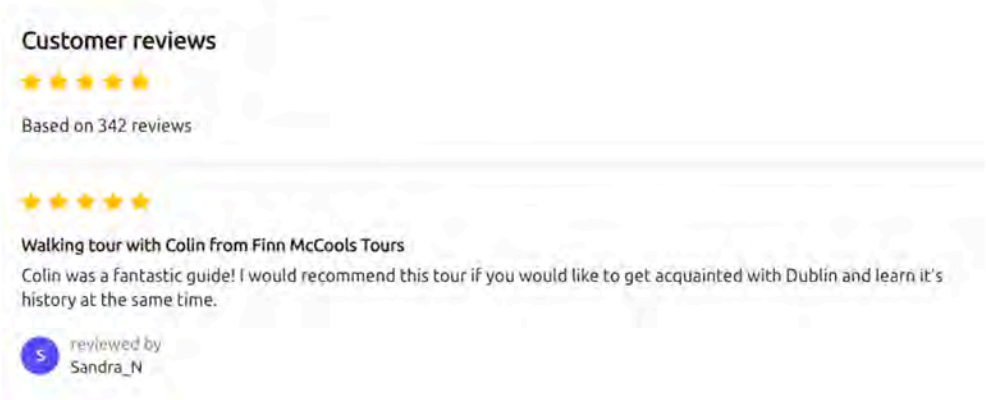
Social Proof

Social proof posited by psychologist Robert Cialdini describes the tendency to copy the behaviour and actions of other people in situations of ambiguity or uncertainty. The internet has digitised word-of-mouth reviews and recommendations, making it much easier for people to rely on social proof as a shortcut for decision-making.

Sometimes we're conscious of this, for example if we take the time to read consumer reviews, but often were influenced unconsciously. For example, without thinking, we might click on an ad that includes a four- or five-star rating, drawn to what appears to be a popular choice.

Social Proof in Product:





Overall

The overall usage of social proof for individual products is excellent, an improvement may be to utilise positive reviews to help aid potential visitors on their journey by placing positive reviews and booking CTA's side by side earlier than when a user has already selected a tour that catches their eye.

Power of Now

Power of now describes the fact that we tend to want things now rather than later. Humans are wired to live in the present – our evolutionary survival hinged on our ability to deal with the problems of the here and now rather than our ability to plan for the future. This explains why people often find it a challenge to save for their future.

Power of Now in Product:

There is currently no filter to show user products that are available now or within the next few hours.

- All-day tours are displayed as starting at 12:00am on the same day as the purchase.
- During the test, several tours only had availability for 3-4 months in the future.

Overall

Tour or activities available for purchase on the same day is poor.

Scarcity Bias

Scarcity bias is based on the economic principle that rare or limited resources are more desirable. As Robert Cialdini states: "*The scarcity principle trades on our weakness for shortcuts*".

Scarcity typically takes one of three forms:

Time-limited: when there is a time limit to a product's availability, it creates a deadline that makes people act before the time is up.

Quantity limited: limited or rare supplies are perceived by people as a threat to their freedom of choice, triggering a reaction to fight the threat and maintain their access to the resource.

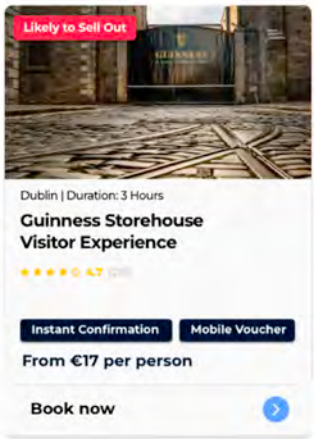
Access limited: meaning limited access to features like information, groups, or spaces. Censorship makes people place a higher value on restricted features because exclusivity makes them feel special

Scarcity Bias in Product:

Time Limited - A time experiment is running for certain user interactions

Quantity Limited - We currently do not display any quantity of tickets remaining

Access Limited - There is currently a 'Likely to sell out' tag applied to tours at random



Overall

Fair - the product does display some scarcity bias, however, there is room for improvement in highlighting tours that are close to selling out or that have limited availability.

'16 others have recently purchased this tour - limited availability'

Power of Free

Power of free describes the fact that there is something special about the price of zero. The demand for a product or service is significantly greater at a price of exactly zero compared to a price even slightly greater than zero.

The power of free can be thought of as an emotional hot button – a source of irrational excitement that can be critical in persuading a consumer to make a purchase decision.

In his book "Predictably Irrational", behavioural economist Dan Ariely writes about a study in which people were given the option to choose between two offers.

One was a free $10 Amazon gift card, the other a $20 gift card that could be bought for only $7. More people chose the $10 gift card, despite the other option offering superior value.

Power Of Free in Product:

The are currently no 'Power of Free' examples being used in the product. It may be a good idea to explore coupling products and offer one as 'FREE' when purchased with the 1st product which is priced the same as the 2 products individually.

Landing Page UX

Non-Verbal Communication

7% Language (What you say)

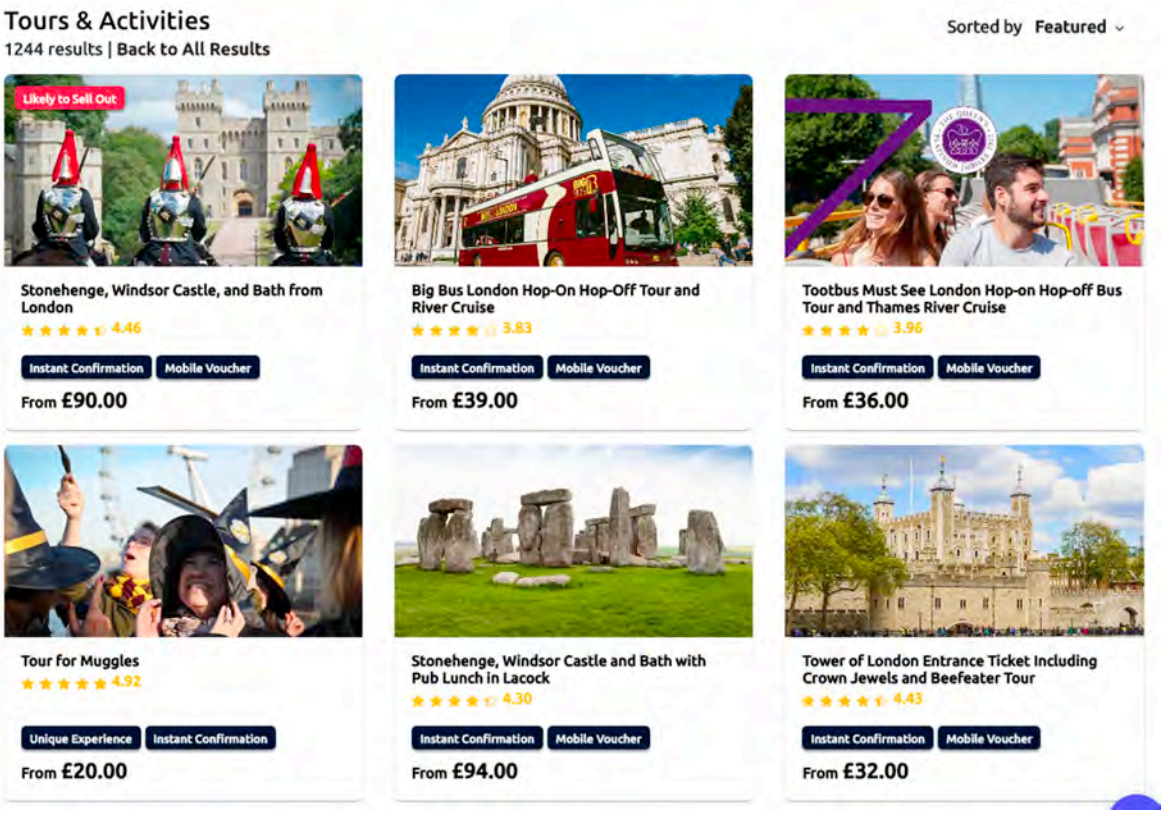
38% Tonality (The way you say it)

55% Body Language (The way you present yourself)

Non-Verbal Communication in Product:

Example location used: London

- 1/3 of Images are lifestyle
- Lifestyle images include smiling people
- Lifestyle images include nice weather



Overall

This aspect of the product is outside of TripAdmit's control given that supply is mainly from a 3rd party source.

The only possible improvement on the homepage could be moving away from scenery banner images to lifestyle images.

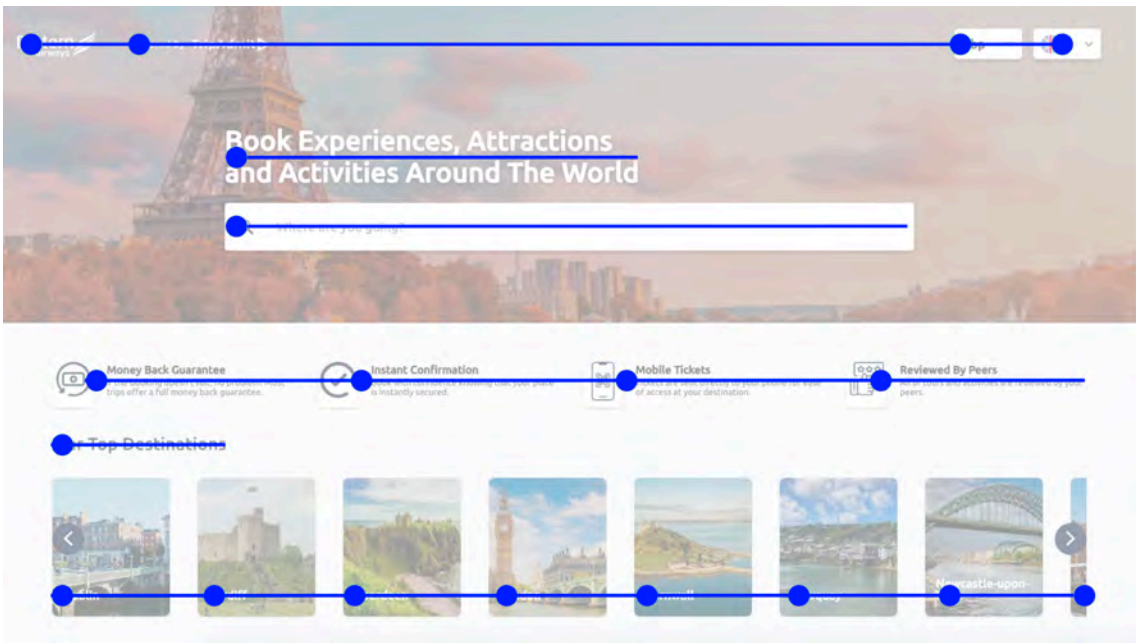
Eye Tracking (Nielsen)

Eye-tracking visualizations show that users often read Web pages in an F-shaped pattern: two horizontal stripes followed by a vertical stripe.

Nielsen's eye tracking is used in UI design to analyze how users visually interact with a web page or product. It helps designers understand where users focus their attention and how they navigate through the page or product. This information is then used to optimize the layout and design of the page or product to improve user experience and engagement. By using eye-tracking, designers can identify areas of low user engagement and make changes to the design to improve the user experience.

Eye Tracking in Product:

Homepage 1st Fold: 19 Eye Tracking

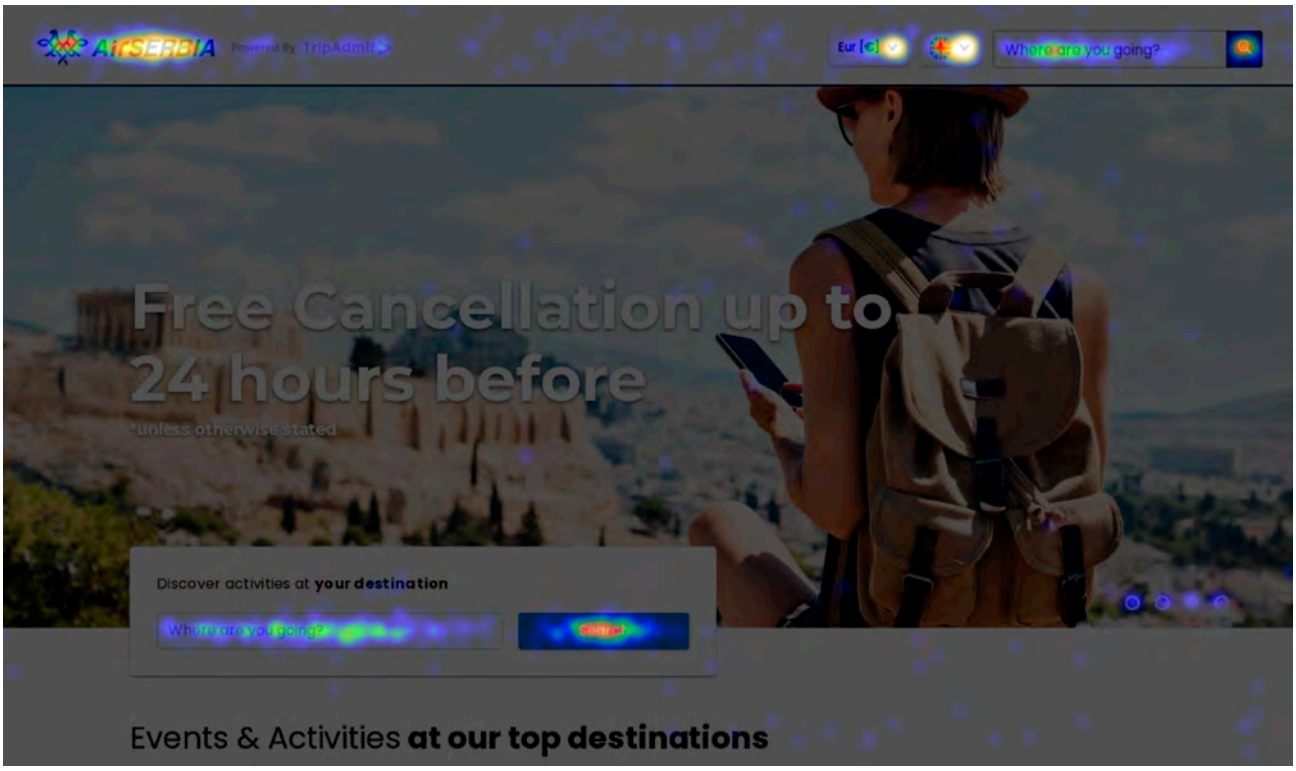


Eye Tracking (Nielsen)

How does this translate into User Behaviour?

Below is a heatmap of user clicks for a White Label client which is based on 5002 User Visits with 5,228 Clicks.

Note: there is another snapshot running on the new WL design (gathering info since 06/04/23)

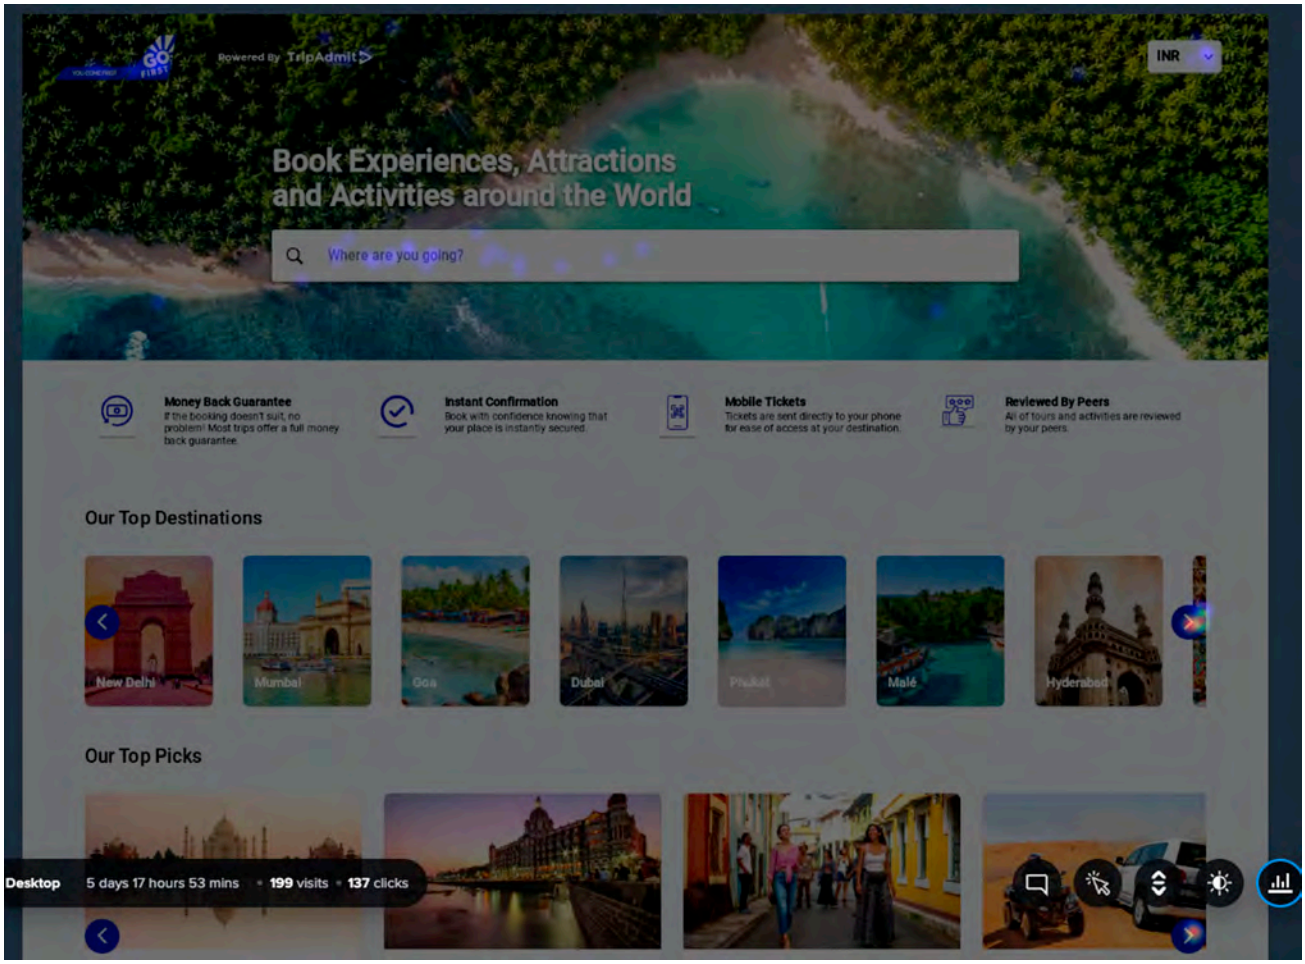


Overall

The height of the homepage banner creates a small cognitive workload for users scanning the page. Most interactions take place in the top left-hand corner of the page and in the main CTA which uses colour to stand out. There are 16 eye-tracking events within the fold of this page, a large proportion of clicks are on the 10th eye-tracking event, this indicates that colour is a strong attractor for users at the beginning of their user journey.

Eye Tracking (Nielsen)

Smaller snapshot of data on new design: 199 Visits, 137 clicks - Note that the majority of clicks are now centred around the large and centred 'Where are you going' CTA.



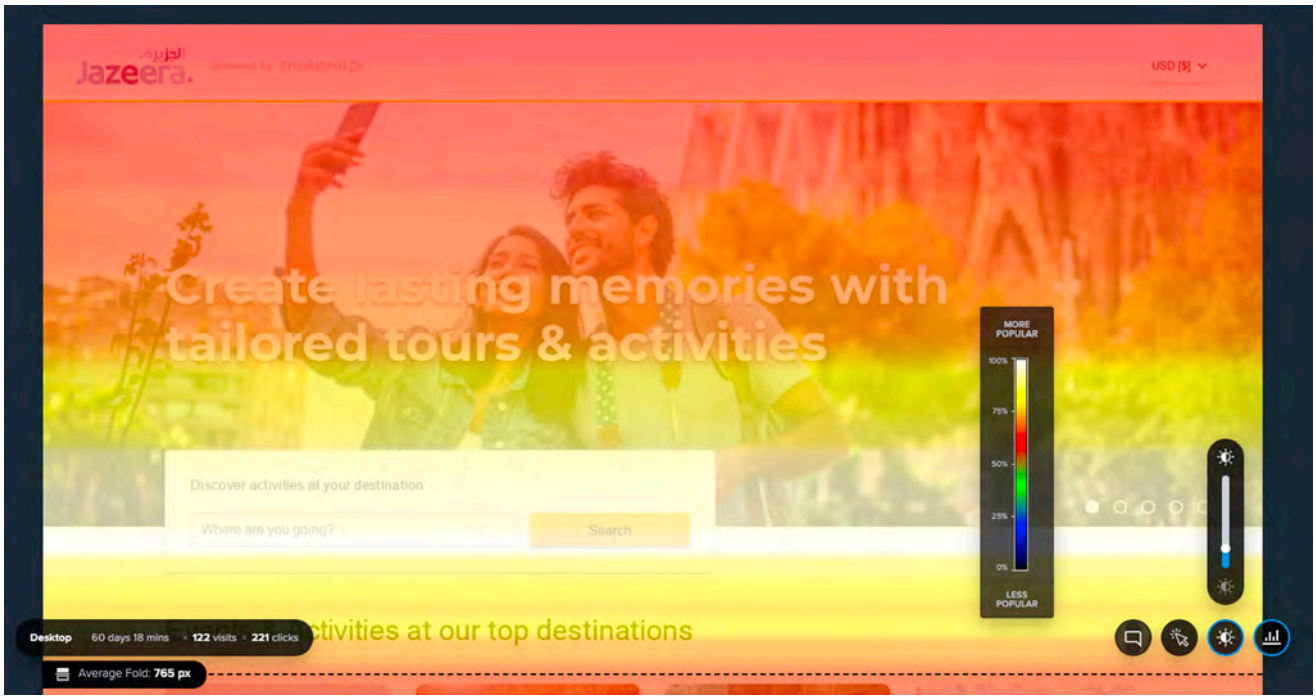
The Fold

The fold in a webpage refers to the portion of the webpage that is visible in the viewer's browser window without the need to scroll.

The Fold in Product:

Based on 122 Visits & 221 Clicks

Average Fold Height: 765px

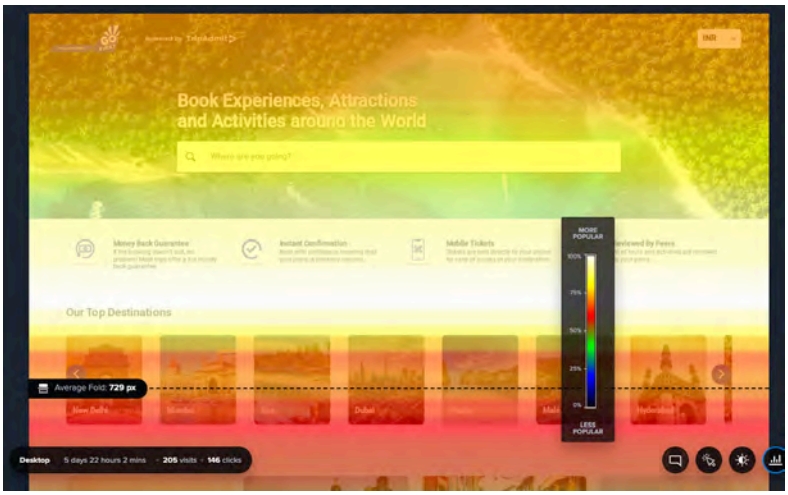


Overall

There is an even distribution of users scrolling up and down, this would indicate that it is not clear where a user should scroll on this page when they first land.

Fold on the New Whitelabel Design

The only clear and obvious CTA within the first fold is the search bar, it may be worth exploring less generic CTA prompts within the first fold.

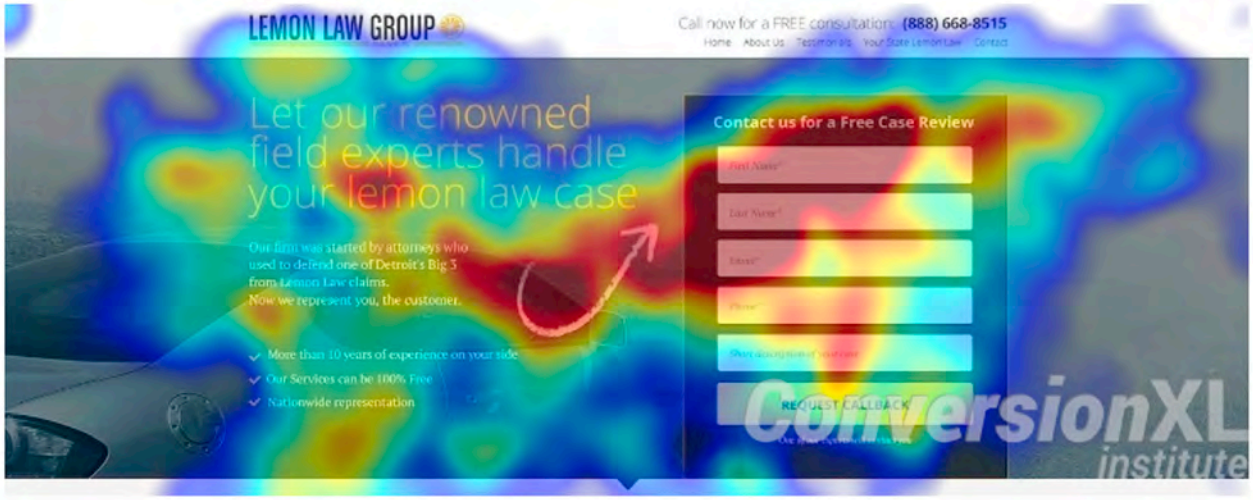


Directional Cues

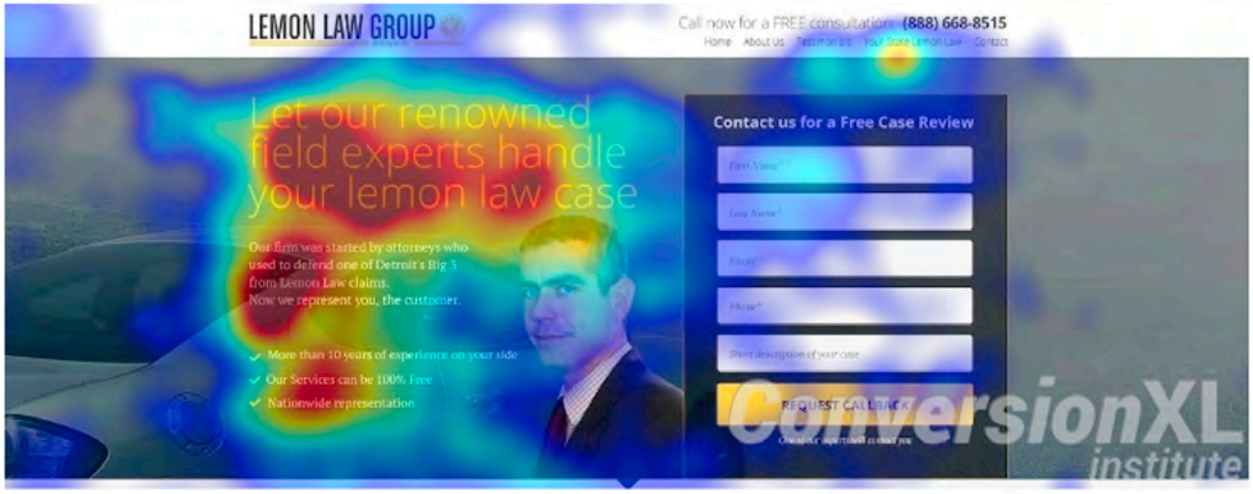
There are 4 primary directional cues

1. White Space Cues
2. Eye Direction Cues
3. Arrows/Linear Cues
4. Encapsulation Cues

Eye Direction Vs Arrows on Heatmaps



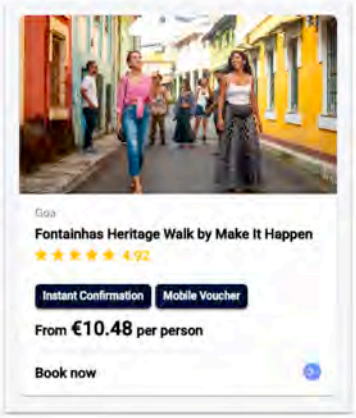
- the version of a page with a man looking away from the form got the least attention and interaction from users.

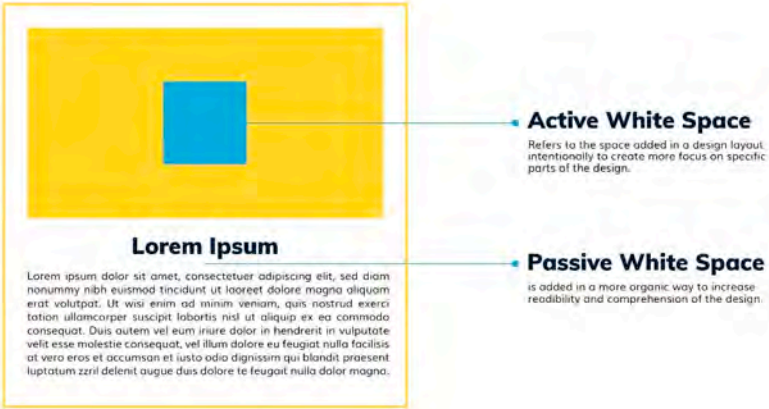


White Space Cues

Direction Cues in Product:

White Space Cues:





Overall

The product utilises active and passive white space well to construct a clear directional cue for individual tours, the main CTA is separated from the rest of the information by a grey line and is closely coupled with another big decision-making cue, the price.

Eye Direction Cues

Eye Direction Cues:

There are no eye direction cues at present

Overall

Overall: Poor, subtle usage of imagery can be used to point a users attention at a call to action button, especially on a screen where the attention ratio is high.

Arrow / Linear Cues

Arrow / Linear Cues:

There are no arrow/linear cues at present

Overall

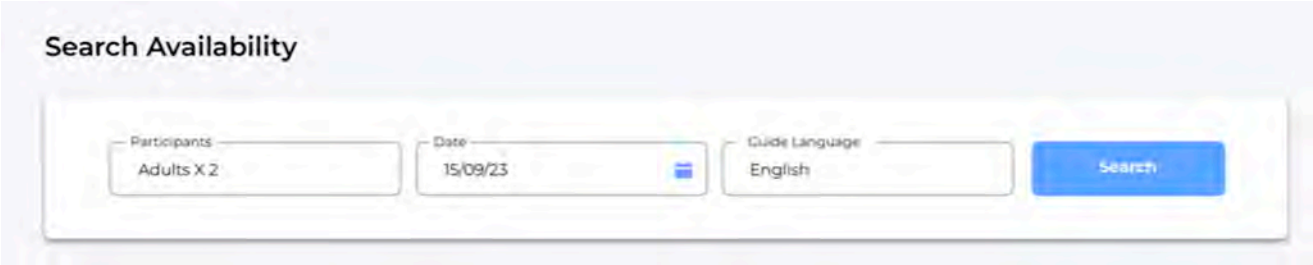
Poor, arrow and liner cues can be utilised to bring a user along a desired user flow and ultimately into the booking flow. There is also no usage of progressive disclosure on the checkout flow.

Encapsulation Cues

Encapsulation Cues in Product:

Search Availability - No Encapsulation

Search Availability - Encapsulation



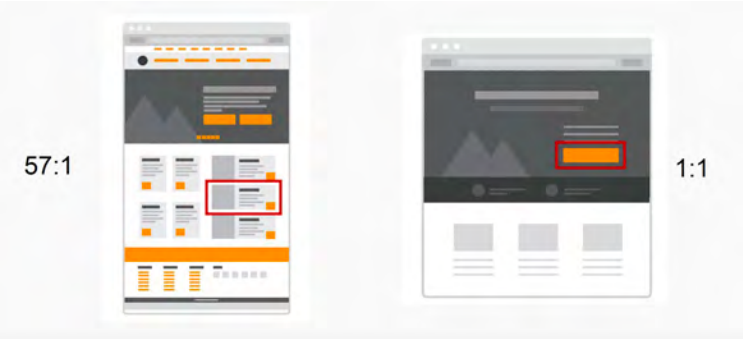
Overall

Good, the current encapsulation experiment for searching availability should help improve conversions from tour to checkout pages, however, an encapsulated widget may work better higher up the page.

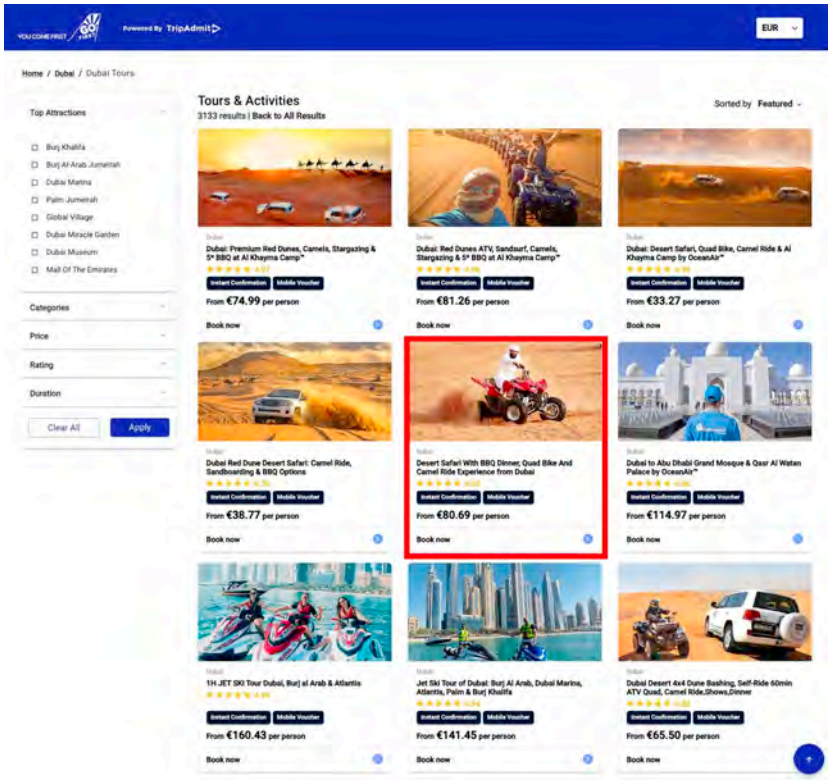
Attention Ratio

Attention ratio is a simple but powerful UX design principle that emphasizes the importance of minimizing distractions and focusing the user's attention on a single, clear CTA. By doing this, designers can improve the user experience and increase the chances that users will take the desired action.

Note: Attention ratio is calculated by counting the number of links on a page vs the campaign goals. The campaign goal of the TripAdmit white label is a successful booking.



Location page attention ratio: **38:1**



Overall

By virtue of the product's purpose of displaying many options for a user in a certain location, the attention ratio is always going to score high. In order to combat the paradox of choice, directional cues should be used to greater effect in order to point a user towards a desired booking option.

The Paradox of Choice

The Paradox of Choice is often encountered when presenting users with too many choices, resulting in a negative impact on the overall user experience. Research has shown that when presented with a large number of options, users are more likely to feel overwhelmed and make suboptimal choices. This can lead to frustration and a sense of regret, even if the chosen option is satisfactory.

To avoid the Paradox of Choice it is essential to strike a balance between offering enough options to meet users' needs while keeping the presentation clear and organized. Designers can use techniques such as categorization, filtering, and progressive disclosure to simplify the decision-making process and provide a more enjoyable user experience.

Hicks Law

Hick's Law, named after British psychologist William Edmund Hick, states that the time it takes for a person to make a decision increases as the number of options available to them increases. This principle is often cited in the context of user experience design, where it is important to limit the number of choices presented to users in order to reduce decision-making time and increase user satisfaction.

Solution

An experiment should be run form the homepage of the Whitelabel where a user is prompted to enter information specific to their trip:

Destination → Participants → Date → Budget Range → Activity Type

Entering this information should generate a condensed list of activities specific to the user's own trip. Directional ques, scarcity bias and the power of now should be used to encourage a booking.

Principles of Landing Pages

Principles of Landing Pages

When it comes to designing a landing page for your website or online campaign, there are several key principles to keep in mind. Here are some of the most important elements to consider:

1. Clear and Concise Message

The message on your landing page should be clear and concise, and quickly communicate the value proposition of your product or service.

2. Attention-Grabbing Headline

The headline should be attention-grabbing and communicate the main benefit of your product or service.

3. Compelling Visuals

The use of high-quality, relevant images or videos can help to capture the attention of visitors and communicate the benefits of your offering.

4. Simple and Intuitive Design

The design of the landing page should be simple and intuitive, with a clear hierarchy of information and a logical flow.

5. Minimal Distractions

Minimize distractions and avoid unnecessary elements that might distract users from the main message or call-to-action.

6. Social Proof

Include social proof, such as customer testimonials or trust badges, to help build trust and credibility with visitors.

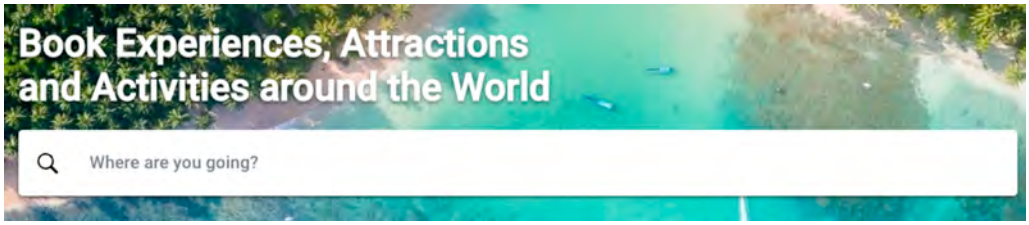
7. Strong Call-to-Action

The call-to-action (CTA) should be prominent, clear, and compelling, encouraging visitors to take the desired action.

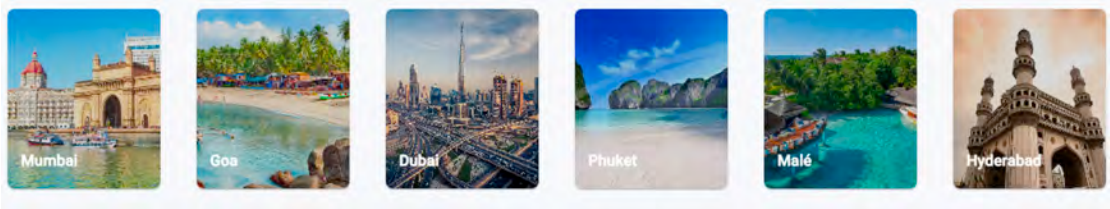
By keeping these principles in mind, you can create effective landing pages that convert visitors into customers, subscribers, or leads.

Principles of Landing Pages

1. Clear and Concise Message & 2. Attention-Grabbing Headline

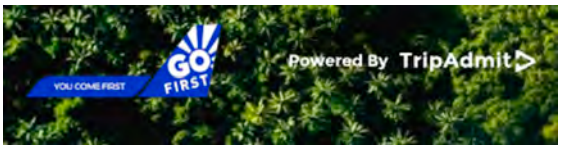


3. Compelling Visuals

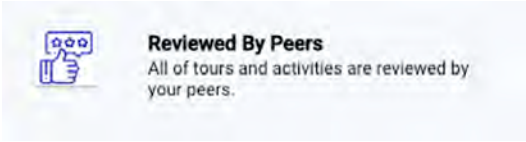


4. Simple and Intuitive Design

5. Minimal Distractions



6. Social Proof



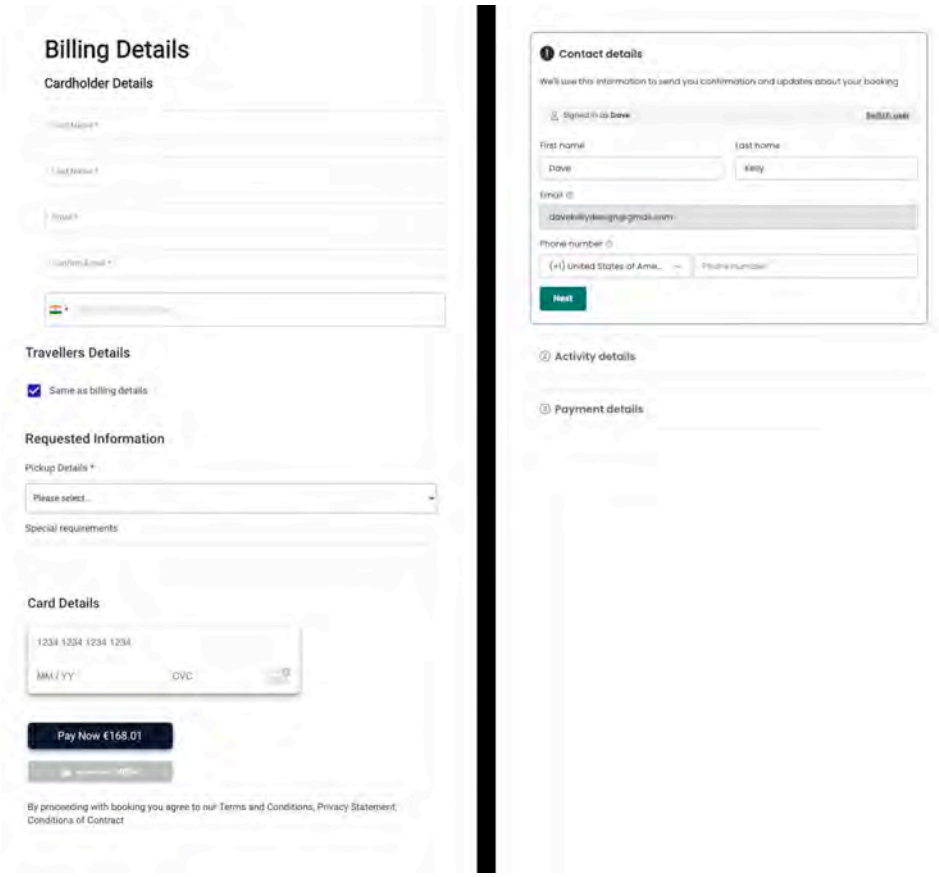
7. Strong Call-to-Action

Note: As there are multiple booking options, we will always struggle to provide a singular, strong call to action.

Form Audit

Reducing the amount of information you require from a potential lead increases the likelihood of conversion

Current Form Vs Stacked Form (Viator)



Currently, the checkout form on TripAdmit's Whitelabel is expanded to include all fields, on the right-hand example, Viator has reduced the form to three separate sections. This lessens the amount of information that a user has to intake at each stage but also provides them with a clear path to completing the checkout through progressive disclosure.

The right-hand example is also sympathetic towards varying supplier requirements e.g pickup, second participant details, custom questions etc by including them in a catch-all section 'Activity Details'.

Overall

Fair, the TripAdmit checkout version isn't a truly bad experience, but a small touchup and sectioning of information may increase user engagement and conversions. An increase in payment options would also help e.g Apple & Google pay.

Checkout Abandonment

When designing a website, it's crucial to understand the reasons why customers abandon their shopping carts during the checkout process. Here are some of the most common reasons:

1. **Complicated checkout process:** If the checkout process is too complicated or takes too long, customers may abandon their carts out of frustration.

2. **Unexpected costs:** Hidden fees, shipping costs, or taxes that are added at checkout can surprise customers and cause them to abandon their carts.

3. **Limited payment options:** If a customer's preferred payment method is not available, they may choose to abandon their cart rather than use a payment method they're not comfortable with.

4. **Website errors:** Technical issues, such as slow loading times, broken links, or server errors, can cause customers to lose confidence in the website and abandon their carts.

5. **Lack of trust:** Customers may abandon their carts if they don't trust the website or the company behind it. This lack of trust can be caused by poor reviews, a lack of security measures, or a general feeling of unease about the site.

By addressing these common reasons for checkout abandonment, web designers can create a smoother, more user-friendly checkout process that encourages customers to complete their purchases.

Other common reasons for cart abandonment include:

- Being asked to create an account before purchase
- Not being able to calculate the total price
- Non-satisfactory returns policy
- Declined payment method

Checkout Abandonment

How do we match up?

Complicated Checkout - The TripAdmit checkout is. not complicated, however improvements to this have been covered in another section

Unexpected Costs - price parity experiments have been conducted between other large suppliers, direct supply and seasonal supply, TripAdmit scores well.

Limited Payment Options - TripAdmits payment option is limited to credit or debit card

Website Errors - TripAdmit performs well in terms of lack of errors and downtime

Lack of Trust - This has been addressed in its own section

Being Asked to Create An Account - There is no account creation

Total Price - The total price is displayed before moving to the checkout screen

Returns policy - The cancellation policy is clearly stated at checkout

Declined Payment Method - Increased payment methods will reduce human error

Overall

Very good, the TriPAdmit platform does a good job of being straight forward, transparent and error-free. Slight improvements could be made in improving payment options and making the checkout process less complicated.

Ockham's Razor

Ockham's Razor is a principle attributed to the 14th-century English logician and Franciscan friar, William of Ockham. It states that, when presented with competing hypotheses to solve a problem, one should select the solution that makes the fewest assumptions. In other words, the simplest and most straightforward explanation is usually the correct one.

This principle has been applied in various fields, including science, philosophy, and theology, to help eliminate unnecessary complexity and support more efficient and effective decision-making.

How complicated is it to purchase a tour or activity on the Tripdmit white label?

If left to make the decision on their own, after landing on the homepage, users will have to consider the following:

Land on homepage → consider destination → consider type of activity I would like to do → search for activity at destination → browser through all activities at destination → consider party size → consider travel date → consider budget → enter required details, search and review options → select option → enter personal & required information → enter payment details → make booking confirmation decision

Cognitive decisions from the homepage to conversion: **12 (with no distractions)**

Overall

At a baseline, it should be possible for a person to search for and book an activity that they are interested in at their destination. However, to implement a cognitive flow that requires fewer decision-making steps from a user, a user must be presented with better-tailored content for their needs sooner in the decision-making process and the steps to conversion must be lessened.

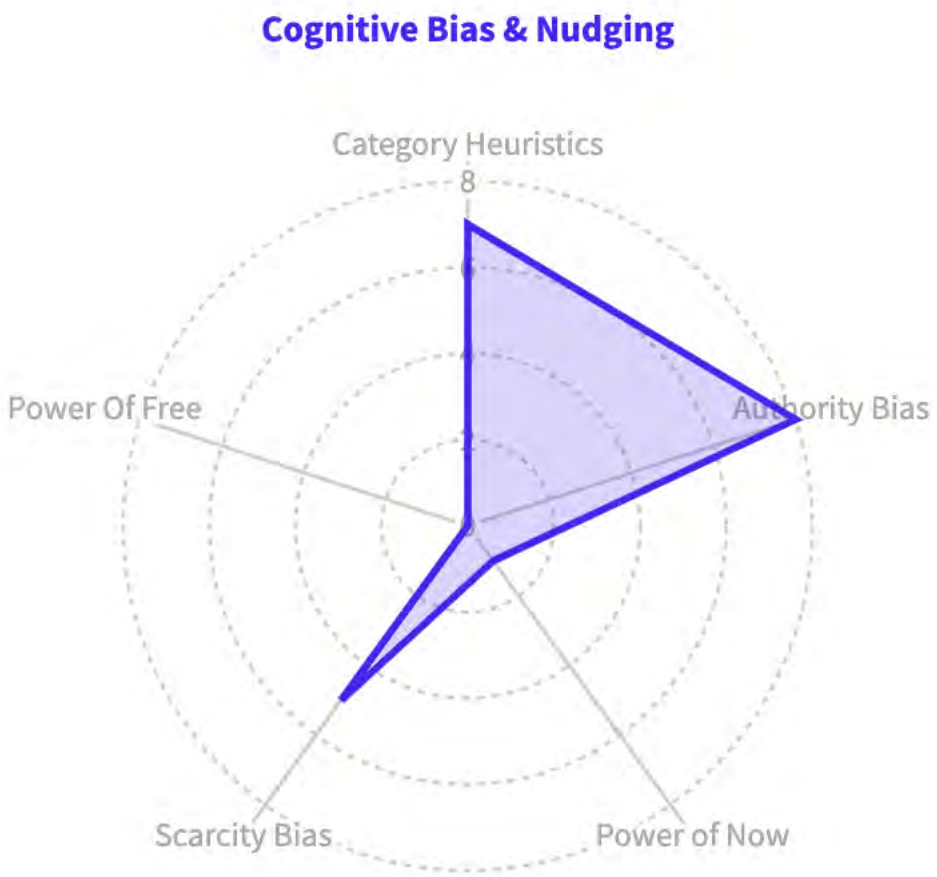
Something like:

Land on homepage → click quick filter to only show certain activity types of interest → enter travel date and select → make booking confirmation decision & pay with apple or google pay

Cognitive decisions from the homepage to conversion: **4**

Cognitive Biases & Nudging - Scoring

Spider Web Evaluation



The main areas of focus for improvement in this area should be scarcity bias and the power of now. This can be achieved through:

UI which displays decreasing stock

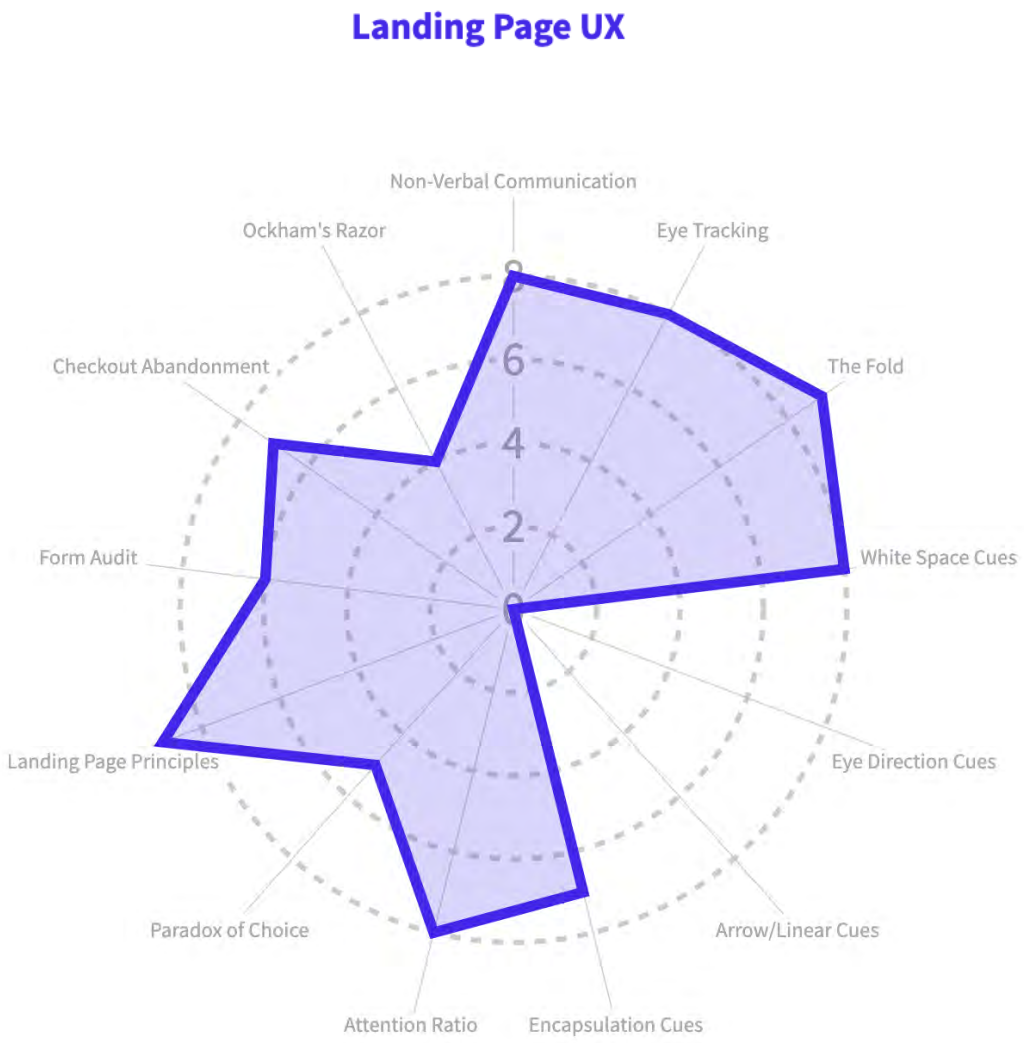
Improvements to the calendar view

how available product is displayed

Total Score: 21/60

Landing Page UX - Scoring

Spider Web Evaluation



The main areas of focus for improvement in this area should be the paradox of choice, form audit, directional cues and Ockham's razor. This can be achieved through:

Progressive disclosure at the checkout

Arrow and directional cues for the user journey

Showing less and more relevant content

Decreasing the amount of decisions needed to make a purchase

Total Score: 69/130
